#### **DETAILED ACTION**

# **Priority**

Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

# **Drawings**

Figure 1 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). Corrected drawings in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. The replacement sheet(s) should be labeled "Replacement Sheet" in the page header (as per 37 CFR 1.84(c)) so as not to obstruct any portion of the drawing figures. If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

The drawings are objected to as failing to comply with 37 CFR 1.84(p)(5) because they do not include the following reference sign(s) mentioned in the description: Figure 4 #24. Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate prior version of the sheet, even if only one figure is being amended. Each drawing sheet submitted after the filling date of an application must be labeled in the top margin as either "Replacement Sheet" or "New Sheet" pursuant to 37

Art Unit: 2828

CFR 1.121(d). If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

## Claim Objections

Claims 4 and 10 are objected to because of the following informalities:

It is believed that claim 4 should depend from claim 2, due to the antecedent basis problems in the claim language, and likewise claim 10 should depend from claim 9. These claims have been examined as such.

Appropriate correction is required.

# Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1 and 7-8 are rejected under 35 U.S.C. 102(e) as being anticipated by Fattaruso (US 6792019).

With respect to claims 1 and 7, Fattaruso discloses a circuit for driving a semiconductor laser comprising a differential amplifier (fig.3 formed of #58, 60, 34, 30) for driving a semiconductor laser directly, a first output of the differential amplifier being direct current coupled to a first terminal of the semiconductor laser (fig.3, diode in general is described as being alternating current coupled in the spec, col.4 lines 15-20, but this is in reference to the capacitor connection, anode is direct current coupled through resistor #34) and a second output of the differential amplifier being alternating current coupled to a second terminal of the semiconductor laser (fig.3 cathode alternating current coupled through capacitor #44).

With respect to claim 8, Fattaruso discloses the circuit and semiconductor laser are disposed on spatially separated integrated circuits (col.1 line 16, implying diode is on separate chip), impedance matched lines of the circuit being provided for connecting the semiconductor laser to the circuit (col.1 lines 20-24).

### Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.

- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Fattaruso in view of Schrodinger et al. (US 2005/0025201).

With respect to claim 2, Fattaruso teaches the driving circuit as outlined in the rejection to claim 1, including the differential amplifier is connected to the second terminal of the semiconductor laser by means of a capacitor, but does not teach a coil and a resistor to be connected in series to ground between the capacitor and diode. Schrodinger teaches a driving circuit for a laser diode wherein a coil and a resistor are connected in series to ground between the capacitor and diode (fig.5 R2, L2). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the driving circuit of Fattaruso with the coil and resistor connection of Schrodinger in order to attenuate the signal and compensate for parasitic capacitances (Schrodinger [0032]).

Claim 3 is rejected under 35 U.S.C. 103(a) as being unpatentable over Fattaruso in view of Mukherjee (US 6226322).

With respect to claim 3, Fattaruso teaches the driving circuit as outlined in the rejection to claim 1, but does not teach the use of variable resistors connected in parallel with the resistors of the differential amplifier. Mukherjee teaches a communications circuit in which parallel variable resistors are used with differential

Application/Control Number: 10/760,397

Art Unit: 2828

amplifiers (fig.15 Rf). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the driving circuit of Fattaruso with the resistors of Mukherjee in order to balance the amplifier gain as need for proper output (Mukherjee, col.28 lines 42-50).

Claims 5-6, and 9-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fattaruso in view of Giles (US 4612671).

With respect to claim 5, Fattaruso teaches the driving circuit as outlined in the rejection to claim 1, including the current inputs (col.2 lines 58-62) but does not teach the use of analog to digital converters. Giles teaches a laser driving circuit that uses A/D converters (fig.1) at the inputs of the differential amplifier. It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the driving circuit, with current control, with the D/A converters of Giles in order to make the amplifier and current source controllable from an outside controlling chip (Giles, abs.).

With respect to claim 6, Fattaruso and Giles teach the driving circuit outlined in the rejection to claim 5, and Giles additionally teaches the use of a microprocessor for executing a program to drive the circuit (Giles, abs.). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the driving circuit of Fattaruso and Giles with the microprocessor of Giles in order to execute various programmable methods for controlling the laser diode.

With respect to claims 9-10, Fattaruso teaches the driving circuit outlined in the rejection to claim 1, but does not teach a method of controlling the laser under specified

events. Giles teaches a laser driving circuit which controls the laser diode by: the circuit measuring characteristic curve data, determining a starting value from the data, the data being determined by varying the start up value as a function of a desired characteristic quantity of the laser (col.3 lines 15-30); and teaches performing the method on a periodic basis to monitor for faults (col.3 lines 59-65). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the laser driving circuit of Fattaruso with the controlling methods of Giles in order to provide for routine maintenance checks of the diode, and to add a degree of automation to the system.

## Allowable Subject Matter

Claim 4 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The following is a statement of reasons for the indication of allowable subject matter:

Claim 4 is believed to be allowable based on the fact that a differential amplifying laser driver circuit having the specified coupling inputs, as well as the claimed coil, resistor, ground placement (between the laser terminal and capacitor), and additionally the further series connection of a coil, two diodes and a resistor placed specifically between the second output of the differential amplifier and the capacitor, was not found to be obvious over the prior art.

Art Unit: 2828

#### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Tod T. Van Roy whose telephone number is (571)272-8447. The examiner can normally be reached on M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Minsun Harvey can be reached on (571)272-1835. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
